

UV SERIES Technical Specifications

Daavlin offers the UV Series phototherapy equipment in a variety of configurations. Units are available with lamp quantities of 12, 16, and 24 in various combinations of UVA, narrow band UVB, and broad band UVB. While the type of ultraviolet lamp (UVA or UVB) does not influence the electrical requirements, the number of lamps contained in a unit does determine the voltage, amperage, wiring and outlet necessary to safely support operation. The table and diagrams below define these requirements for each model variation in the UV Series. Follow these specifications and all national and local electrical codes when preparing the electrical supply prior to the installation of a UV Series phototherapy device.

This unit should be on a dedicated circuit.
